

## Creating a database repository questionnaires Studies Library at the University of Haifa

The University of Haifa's Younes and Soraya Nazarian Library

Avishay Evrony

Advisor: Mrs. Dana Lotan

Information and knowledge management in academic libraries requires innovative tools and more efficient ways to achieving the objective. Role of the reservoir questionnaires is to expose and open exchange of learning and knowledge in better and faster way, so that we gets search tool that is multidisciplinary offering the user the possibility of retrieval bibliographical accessible collection of a wide range of measures psychologists such as ladders, surveys and other essential research needs of students and to Yes access to the full study.

The Purpose of my project is Access to the questionnaires directory database services and increasing the reservoir so that the student will be a wider range of research tools in the study.

During the practicum I helped to cover "gray literature", includes works thesis master's degree, doctoral theses and research reports. Before setting up the database, gray literature published in publications walls, so the inclusion of gray literature as part of the reservoir discernible in the center of knowledge makes it more accessible and available more quickly and efficiently and all practitioners are exposed to this important literature. the studies are in the database within the system and which have to take out the questionnaires according to the type, content and location in the text.

The database currently contains multidisciplinary bibliographic information making it possible to find material published in Hebrew and English in a variety of disciplines and at different levels. The database contains references to the 3264 questionnaires from theses written at the University of Haifa, of which 140 were added in recent months. The database also contains references to research other languages that offer the user a variety of options for searching all academic and professional databases.

My Conclusion and Recommendation when I wrote this practicum I understood the importance of building a database of publications to facilitate students and researchers

during their research to their exposure to various tools that researchers used in their study, I recommend conducting surveys among students and researchers to improve the database, and the publication of the reservoir to expose many students to the database.

The database is a tool for creating and collecting new knowledge. Database of publications concentration brings to streamline work processes and the services provided by the library plate leaves the reservoir will result in the empowerment of the importance of the role of the librarian changing technological environment and establishing status as a professional imperative necessary to respond reliable, accurate and quick adjusting opponent user's request. The practicum can Contribution to Nimoy University Library is in the midst of increasing database which can assist students in finding research tool for research in the second degree. The Participation has allowed me to be exposed to information management processes closely and enterprise knowledge and experience the different stages from planning the project to running the pilot. In my work I learned about the possibilities inherent in the system "500 thousand" and the principle according to which the system operates.
