

## SharePoint Implementation

Organization: Philips Medical

Student Name: Dudi Deri

Advisor: Uzi Yona

Philips is a company that manufacturing electronic products for the home market and advanced medical devices. Philips is a global company that has development and manufacturing centers around the world. In Haifa there is a development and production center for CT systems (Computed Tomography). Knowledge - is a product of learning which is essential to the functioning of any organization. Collecting, saving and updating it today requires a systematic and professional approach. Global companies now recognize the importance of organizing and knowledge sharing among employees in the organization. Knowledge management is a tool that supports the goals of the organization. One of the knowledge management tools is Share Point. The share point implementation required five phases from planning till the project implemented: Getting the support of senior management, establishment of a team, schedules and defining measures of success / failure, Requirements definition, Website development, Functional testing, Release the Website and train the users. The project was launched in December 2012 and ended in April 2013. Today it is very difficult to imagine our global group without a website for sharing knowledge and information. The new system enables to take much faster decisions. If in the past it took a full day to create a status report today we can do it within a few minutes from anywhere in the world! The group began to speak in a "unified/Single voice." The project is much appreciated by our management and by our group members who understand the impact on the team.
